

```

const int Redlight = 10;
const int Yellowlight = 9;
const int Greenlight = 8 ;
int state = Redlight;
void setup() {
  // put your setup code here, to run once:
  pinMode(Redlight, OUTPUT);
  pinMode(Yellowlight, OUTPUT);
  pinMode(Greenlight, OUTPUT);
}

```

```

void loop() {
  switch(state) {
  case Redlight :
    digitalWrite(Redlight, HIGH);
    digitalWrite(Yellowlight, LOW);
    digitalWrite(Greenlight, LOW);
    delay(5000);

```

```

    state = Yellowlight;
    break;

```

```

  case Yellowlight :
    digitalWrite(Redlight, LOW);
    digitalWrite(Yellowlight, HIGH);
    digitalWrite(Greenlight, LOW);
    delay(2000);
    switch(state){
      case Redlight :
        state = Greenlight;
        break;
      case Greenlight :
        state = Redlight;
        break;
      case Yellowlight :
        state = Greenlight;
        break;
    }
    break;

```

```

  case Greenlight:
    digitalWrite(Redlight, LOW);
    digitalWrite(Yellowlight, LOW);
    digitalWrite(Greenlight, HIGH);
    delay(5000);
    state = Redlight;
    break;
  }
}

```

STATE FLOW

Pin numbers corresponding to the various light colours get declared as int values and then as output variables. Loop: Red----> Yellow (checks if previous state was red or green. if red, then changes to green and it was found to be green, then changes to red.)-----> Green----->yellow...
